

Certificate

Of Penetration Test

Finding summary

Libre invited Cybaverse to conduct an AWS Configuration Review of their cloud environment to identify security issues and misconfigurations which affect the overall security posture of the environment. Testing commenced on 29th Feb 2024.

It should be noted that any assessment activities performed reflect the vulnerability exposure of an organisation at the time of the test. Those additional vulnerabilities may subsequently arise following assessment completion. Every effort is made to ensure that assessment resources are up to date at the time of the assessment; and that all public exploit data is utilised as a part of the engagement process.
