

Certificate

Of Penetration Test

This is to certify that Cybaverse Ltd has successfully completed a Web Application Penetration Test, External Infrastructure Penetration Test and API Security Test on:

Libre

06 March 2024

These assessments were designed to identify the status of previously identified vulnerabilities or weaknesses that existed within the web applications and provide recommendations for mitigating any potential risks.

In the retest of Libre's external infrastructure, the testing consultant observed that all previously identified findings have been remediated. The security posture of the API remained to exceed what's expected in the industry. Overall, the security posture of the web application was found to be above industry standard, demonstrating a robust implementation of security measures and practices with only one low rated finding present.

All ratings are as per CVSSv4.0. It is advised to ensure that the remediation advice offered within this report is implemented across the entirety of applications and systems rather than focused on specific pages, parameters, or hosts.

It should be noted that any assessment activities performed reflect the vulnerability exposure of an organisation at the time of the test.

The Libre logo, consisting of a purple shield with a pink border and the word "Libre" in white serif font.

Libre

A handwritten signature in black ink that reads "Myles Lawson".
